Task – 11

Blinkit Sales & Performance Dashboard Report

10 March 2026

Tool Used: Power BI

Task Description

Introduction

The objective of this project is to analyze Blinkit grocery sales data and build an interactive Power BI dashboard that provides insights into sales performance, product categories, outlet performance, and customer satisfaction. The dashboard helps in identifying key trends, top-performing products, and areas that can support better business decision-making.

The analysis focuses on understanding sales distribution across product categories, outlet types, outlet locations, and customer ratings. Using data visualization techniques, the dashboard converts raw data into meaningful insights that can assist in improving business strategy and operational efficiency.

Dataset Overview:

The dataset used for this project contains information about grocery products sold through Blinkit outlets. It includes details about product types, outlet characteristics, sales performance, and customer ratings.

Key Dataset Columns

Column	Description
Item Identifier	Unique ID for each product
Item Type	Category of the grocery product
Item Fat Content	Indicates whether the product is Low Fat or Regular
Item Weight	Weight of the product
Item Visibility	Product visibility in stores
Outlet Identifier	Unique ID for the outlet
Outlet Establishment Year	Year the outlet was established
Outlet Size	Size of the outlet (Small/Medium/Large)
Outlet Location Type	Tier classification of outlet location
Outlet Type	Type of store (Supermarket, Grocery Store etc.)
Sales	Total sales value of the product

Column	Description
Rating	Customer rating for the product

The dataset helps analyze product performance, outlet performance, and customer satisfaction trends.

Methodology

1. **Data Collection**

   The Blinkit grocery sales dataset was imported into Power BI from an Excel file.

2. **Data Cleaning and Transformation**

   Data cleaning was performed using Power Query to ensure accuracy and consistency. Tasks performed include:

   - Standardizing values in Item Fat Content
   - Handling missing values
   - Correcting data types
   - Removing duplicate records

3. **Data Modeling**

   The dataset was structured in Power BI to support analysis and reporting. Measures were created using DAX to calculate key metrics such as total sales, average sales, total items, and average customer rating.

4. **Data Visualization**

   Various charts and visual elements were created to represent the data visually and identify patterns, trends, and insights. Interactive slicers were also added to allow dynamic filtering of the dashboard.

Explanation of Dashboard Visuals

KPI Cards

KPI cards display important performance indicators such as:

- Total Sales
- Average Sales
- Total Number of Products
- Average Customer Rating

These indicators provide a quick overview of the business performance.

Sales by Item Category

A bar chart was used to visualize sales across different product categories. This helps identify which categories contribute the most to overall revenue.

Sales by Outlet Location

A pie chart was used to analyze sales distribution across different outlet location types (Tier 1, Tier 2, Tier 3). This visualization highlights the geographical contribution to sales.

Sales by Outlet Type

A column chart displays how different outlet types perform in terms of sales. It helps determine which store format contributes the most revenue.

Sales Trend Analysis

A line chart was used to analyze sales trends over the years based on outlet establishment year. This visual helps identify business growth patterns.

Top Performing Products

A table visualization highlights the top-selling products based on sales performance. This helps identify products that contribute significantly to overall revenue.

Average Rating by Category

A column chart displays the average customer rating for different product categories. This helps evaluate customer satisfaction and product quality.

Sales by Item Fat Content

A donut chart shows the distribution of sales between Low Fat and Regular products, helping understand customer preferences.

Sales by Outlet Size

A column chart was used to analyze the sales performance of small, medium, and large outlets.

Key Insights and Observations:

1. Snack foods and fruits & vegetables generate the highest sales among all product categories, indicating strong customer demand for essential grocery items.
2. Supermarket Type1 outlets contribute the highest sales, suggesting that larger outlets attract more customers and offer a wider variety of products.
3. Tier 3 outlet locations contribute a significant portion of sales, indicating strong demand in smaller cities and developing markets.
4. Medium-sized outlets show strong performance compared to small and large outlets.
5. Several top-performing products contribute significantly to overall sales, highlighting the importance of product assortment and availability.
6. Customer ratings across most product categories remain relatively high, indicating positive customer satisfaction and trust in the products offered.

Conclusion

The Blinkit Sales & Performance Dashboard provides a comprehensive analysis of grocery sales data by transforming raw transactional data into meaningful business insights through interactive visualizations. The analysis highlights key factors that influence sales performance, including product categories, outlet types, outlet locations, and customer ratings.

From the analysis, it is evident that essential grocery categories such as **Snack Foods, Fruits & Vegetables, and Dairy Products contribute significantly to overall sales**, indicating strong and consistent customer demand for daily-use items. The dashboard also reveals that **Supermarket Type1 outlets generate the highest revenue**, suggesting that larger retail formats with a wider range of products attract more customers and drive higher sales.

Another important observation is that **Tier 3 outlet locations contribute a substantial share of sales**, demonstrating the growing demand for online grocery delivery services in smaller cities and emerging markets. This highlights the potential for businesses like Blinkit to expand their operations in these regions to capture increasing market demand.

The analysis of outlet size indicates that **medium-sized outlets perform particularly well**, as they offer a balance between product variety and operational efficiency. Additionally, the sales trend visualization indicates a **steady growth in sales across establishment years**, reflecting the expanding retail presence and increasing customer reliance on online grocery platforms.

Customer ratings also play an important role in evaluating product performance and service quality. The majority of products maintain **positive ratings, suggesting overall customer satisfaction with product quality and delivery experience**. However, a few categories show relatively lower ratings, which presents an opportunity for businesses to improve product quality, packaging, or service processes.

Overall, this dashboard demonstrates the power of **data-driven decision making** by enabling businesses to monitor performance, identify growth opportunities, and improve operational strategies. By leveraging insights from sales data, organizations can optimize product offerings, enhance customer satisfaction, and strengthen their competitive position in the rapidly growing online grocery market.

Recommendations

Based on the analysis, the following recommendations can be made:

1. Focus on expanding high-performing product categories such as snack foods and fresh produce.
2. Improve product availability in Tier 3 locations where demand appears strong.
3. Continue investing in supermarket-style outlets that generate higher sales.
4. Monitor lower-rated product categories and improve quality, packaging, or delivery service to enhance customer satisfaction.
5. Use data-driven insights to optimize product assortment and marketing strategies.
